Mobile Data Computer

MDC's have been installed in all of the vehicles for the deputies and the lieutenants. The computers allow access to the management information system at the sheriff's office and the TIME system to access driver and vehicle records.

The computers are equipped with wireless internet capabilities so the deputies can access information via the internet. The system allows them to exchange information silently uring their shift and to enter data on calls, relieving some of the workload from the communications center. By viewing the screen, a deputy has a real time picture of where each officer is currently assigned and who is available to respond to incoming calls.
